antiarheumatic, nephrotropic, antianteriosippreserve, injunimental antianteriosippreserve, antianteriosippreserve, antianteriosipprotective, antianteriosic antianteriosic antianteriosic cardiant and hepatropic activity. (I) induce apoptosis by binding to call surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic diseases associated with the Fas/Fas ligand system, especially systemic versus host disease, Slorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic); and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They band to be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do nottinduce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HEPAA designed light chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 METDTILLWVLLLWVPGSTGDIVLTOSPGTLSLSPGERATLSCKASOSVDYDGDSYMNWY 60

This is the amino acid sequence of the HW type humanised light chain of murine anti-human Fas monoclonal antibody HFF7A.

Humanisation of the murine sequence (see AAW83042) entailed making P47A and K49R amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell E. coli pHSGHM17 SANK 73597 harbors plasmid pHBSGHM17 carrying a fusion fragment of the humanised HW type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6072 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW8301-37). like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autcimmne classes (e.g. systemic lupus erythematchsus, Hernichous anaemia, addisease, rheumatchia remissioned autoimmus haemolytic anaemia, disease, rheumatchia remissioned autoimmus musuchia remissioned autoimmus musuchia remissioned autoimmus musuchia remissioned autoimmus musuchia remissioned autoimmus au
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,

antibodies.

ö The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the muther anti-human Fas monoclonal antibody HFE7A, or a humanised version offerment anti-human for dentical CDRs (complementarity determining regions) to antibody HFE7A, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis AIDS and organ graft rejection; Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulogaphritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain. rreventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody QOKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPADFAVYYCQQSNEDPR 120 121 TFGQGTRLEIKRTVAAPSVRÄFPPSDEQLKSGTASVVCLLNNFYPREAKVQMKVDNALQS 180 121 tfgggtrleikrtvaapsvfyfppsdeglksgtasvvcllnnfypreakvgwkvdnalgs 180 Gaps 9 ö Indels Humanised anti-Fas antibody light chain, SEQ ID NO:52. 9 1; Mismatches Claim 20; Page 80-81; 139gp; Japanese. continuents in cells with amormal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-diabetic anti-arbhitic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiviral, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antirheumatic, nephrotropic, antiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated withfilme Fas/Fas ligand system, especially systemic versus host disease, Slorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, relatively, pernicious or hypoplastic anemia, addison's disease, thrombopenia purpura, insulin dependent diabetes mellitis, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholicy and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to bothymuman and murine Fass, so can be evaluated in mormine disease models. (I) act on the active site of Fas i.e. they mimic the native ligand, do noffinduce liver disease, and have reduced risk of inducing a human anti-murine antibody FESA light chair which is used in the method described in the light chain HM type which is used in the method described in the light chain the produced in the method described in the light chain the produced in the method described in the light chair the light chair the light chair the light chain the method described in the light chain the l

Kimihisa I;

This is the amino acid sequence of the PDHM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAR83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host call Escherichia coli pHSHM2 SANK 70198 harbors plasmid pHSHM2 carrying a fusion of the humanised PDHM type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6272 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells.

KFE7A, are capable of inducing apoptosis in abnormal cells. Cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas 199and interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, capable of sydrem Goodpasture syndrome, Crohn's disease, rheumatotid arthritis, autoimmune haemolytic anaemia, etchilit, manaemia, multining has an encountered and sease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatotid arthritis, autoimmune haemolytic anaemia, etchilit, musaethod arthritis, autoimmune haemolytic anaemia, etchilit. sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the FasFas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the mutine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arterioscienceis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection Sequences AAB14772-B14774 and AAB14777-B14778
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti-Fas antibody; monoclonal antibody HFB7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomeruloimphritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.

molecule (I) that, induces apoptosis in cells with an abnormal FassFasco ilgand system, by binding to Fas on the cells with an abnormal FassFasco ilgand system, by binding to Fas on the cells with an abnormal FassFasco ilgand system, by indinibiting binding between a people is a motivated in the products of the invention have anti-inflammatory, anti-anamic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomouppressive, thyronimetic, antidiabetic, antidiffertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce cappropiss by pinding to cells surface Fass or inhibit to propertieve inhibition of ligand binding. (I) are used to treat and/or prevent inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic upus serythematosus, Hamimore disease, rheumatoid arthritis, graft versus host disease, slorgen's syndrome, pernicious or hypoplastic versus host disease, slorgen's sterility, myasthenia gravis, allergy, allergy, atteriosclerosis, myocarditis, cardiomyopathy, glomerulomephritis, hepatitis (fulminant, chronic, viral cells mormal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-marked antibody Hers/A designed light chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPADFAVYYCQQSNEDPR 120

This is the amino acid sequence of the MM type humanised light

C chain of murine anti-human Fas monoclonal antibody HFE7A. E. coli

SANK 73697 harbors plasmid pH8GMM6 carrying a fuaton fragment of the

chain of mutype HFE7A light chain and DNA encoding the region of

human kappa chain, and is deposited as FERM BP-601 (claimed). The

culvarion provides methods for producing humanised antibodies by

culturing host cells. Humanised versions of HFE7A (see AAM80301-37),

like native HFE7A, are capable of inducing apoptosis in abnormal

cells expressing Fas, and of inhibiting Fas-induced apoptosis in

commal cells. The humanised antibodies are used to evaluate, in

animal models, treatments of diseases that involve Fas/Fas ligand

interactions, and also to treat such diseases, including autoimmune

c disease (e.g. systemic lupus erythematosus, Hashimoto's disease,

c disease, creamatoid arthritis, autoimmune haemolytic anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Akio S, Hideyuki H, Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the mutine anti-human Fas monoclonal antibody HFFTA, or a humanised version of HFFTA containing identical CDRs (complementarity determining regions) to antibody HFFTA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFF7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas Iigand; apptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomeruloipephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.

rigging system, by Allengue, to read the cell stillate, and pievenes apoptosis in cells with abouts of the invention have anti-inflammatory. Fas and its ligand. The products of the invention have anti-inflammatory. Continenate, anti-diabetic, anti-arthritic, anti-iral.

Continenate, antidiabetic, anti-arthritic, anti-iral.

Continenatic, nephrotropic, antidifertility, neuroprotective, antiarterioscieroric, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic upus erythematosus, Hashimoto disease, rehumatoid arthritis, graft versus host disease, Slorgen's syndrome, pernicious or hypoplastic conenia, Addison's disease, acleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulopephritis, hepatitis (fulminant, chronic, viral (8, C or D) or alcoholic), and transplant rejection. (I) selectively infinite apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of induced and anti-marian and murine disease, and have reduced risk of induced and anti-mariant anti-mariant and anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant anti-mariant and anti-mariant anti-mariant and anti-mariant and anti-mariant and anti-mariant and anti-mariant and anti-mariant anti-mariant and anti-mariant and anti-mariant and anti-mariant and anti-mariant and anti-mariant and anti-mariant and ö inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HFE7A light chain MM type which is used in the method described in the invention. 61 qqkpqqppklliyaasnlesg1pdrfsgsgsgtdftltihpveeedaatyycqqsnedpr 120 QQKPGQAPRLLIYAASNLESGIPDRFSGSGSGTDFTLTISRLEPADFAVYYCQQSNEDPR 120 121 TFGQGTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180 Gaps GNSQESVTEQDSKDSTYSLSSTLTLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC 238 1 METDTILLWVLLLWVPGSTGDIVLTQSPGTLSLSPGERATLSCKASQSVDYDGDSYMNWY ö Length 238; le (I) that, induces apoptosis in cells with an abno system, by binding to Fas on the cell surface, and Indels Score 1194; DB 21; Pred. Sequence 15, Application US/09109207C
Patent No. 6172213
GENERAL INFORMATION
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe
TITLE OF INVENTION: Improyed Anti-1gE Antibodies and Method of Improving Polypep
FILE REFERENCE: P1123R1
CURRENT APPLICATION NUMBER: US/09/109,207C
CURRENT FILING DATE: 1998-06-30
                 Sequence 24, Application US/08887352B
Patent No. 5994511
GENERAL INFORMATION:
APPLICANT: Henry B. Lowman, Leonard G. Presta, Paula M. Jardieu, John Lowe TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of NUMBER OF SEQUENCES: 26**
CORRESPONDENCE ADDRESS: **
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GIPDRFSGSGSGTDFTLTISRLEPADFAVYYCQQSNEDPRTFGQGTRLEIKRTVAAPSVF 140

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Accession: JC5810
R; Akashi, S.; Kato, K.; Torizawa, T.; Dohmae, N.; Yamaguchi, H.; Kamachi, M.; Harada Biochem. Biophys. Res. Communi 240, 566-572, 1997
A; Title: Structural characterization of mouse monoclonal antibody 13-1 against a por A; Reference number: JC5810; MujD: 98063277
A; Reference number: JC5810
A; Molecule type: protein
A; Residues: 1-218 <AKA>
C; Comment: This catalytic antibody has peroxidase oxidase. It is directed against a C; Superfamily: immunoglobuling region; immunoglobuling region; immunoglobuling viewns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cispecies: Mus musculus (house mouse)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ig kappa chain V region (Mab13-1) - mouse (fragment)
N;Alternate names: immunoglobulin light chain
C;Species: Mus musculus (house mouse)
C;Accession: 568241; 568214
R;Takagi, M.; Kohda, K.; Hamuro, T.; Harada, A.; Yamaguchi, H.; Kamachi, M.; Imanaka, T.
Submitted to the EMBL Data Library, March 1994
A;Description: Specific peroxidase activity by formation of an antibody L-chain-porphyrial A;Reference number: 568241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rat myeloma immunoglobulin kappa chain cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ŧ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                with a recombinant antibody L chain-porphyrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A;Cross-references: EMBL:D29670; NID:9473962; PIDN:BAA06141.1; PID:9473963

Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, Theumatoid arthritis, autoimmune haemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arterfosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAW83042) entailed making P47A and K49R amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell E. coli pHSGHM17 SANK 73597 harbors plasmid pHSGHM17 carrying a fusion fragment of the humanised Hw type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6072 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native expressing Fas, and of inhibiting Fas:induced apoptosis in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the HM type humanised light
                                                                                                                                                                                                                                                                                                                                                                                   Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas, suntibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFF7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFF7A, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, attendedselves, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft@rejection; light chain. Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains TFGQGTRLEIKRTVAAPSWFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180 181 GNSQESVTEQDSKDSTYSLSSTLTLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC 238 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; Humanised anti-Fas antibody light chain, SEQ ID NO:52. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosuparessive, thyronimetic, antirheumatic, nephrotropic, antilhertillty, neuroprotective, antiatreniosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic nemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Pas antibody HEPZA light chain HM type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QQKPQQAPKLIYAASNIESGIPDRFSGSGSGTDFTLTIHPVEEEDAATYYCQQSNEDPR 120

This is the amino acid sequence of the PDHM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAM83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell Escherichia coll pHSM2 SANK 70198 harbors plasmid pHSHM2 carrying a fusion of the humanised pDHM type HFF7A light chain and deposited as FERM BP-672 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFF7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal models. Treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune graft press and also to treat such diseases, including autoimmune graft press and sot diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune graft press and such account of the provise such and also to treat such diseases, including autoimmune graft press and passes and provises ansemia, addisease and addisease Sigutems Condense Pressions ansemia, addisease and passes and provises and passes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas, or a bumanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerois, myocarditis, cardiomyopathy, allergy, atopy, arteriosclerois, myocarditis, cardiomyopathy, allergy, atopy arteriosclerois, myocarditis, cardiomyopathy, and organ graft rejection. Sequences AAB14772-B14774 and ABB14777-B14778 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                          murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody

The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New humanized anti-Fas antibody, useful for treating or preventing e.g.

antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
composits by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
diseases associated with the Fas/Fas ligand system, especially systemic
complete supplementations, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
anenia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, alleray, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
completes an alcoholic), and transplant rejection. (I) selectively
cinhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
complete and induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
the native ligand, do not induce liver disease, and have reduced risk of
the native manised anti-murine antibody response. This sequence represents
the nearbook and the factor of the active site of fas, is a con the contractive in the active of a humanised anti-murine antibody response. This sequence represents

This is the amino acid sequence of the MM type humanised light

C chain of murine anti-human Fas monoclonal antibody HFE7A. E. coli

SANK 73697 hatboors plasmid pH8CMM6 carryling a fluation fragment of the

C humanised MM type HFE7A light chain and DNA encoding the region of

human kappa chain, and is deposited as FERM BP-6071 (claimed). The

culturing host cells. Humanised versions of HFE7A (see AAM83031-37),

like native HFE7A, are capable of inducing apoptosis in abnormal

c cells expressing Fas, and of inhibiting Fas-induced apoptosis in

normal cells. The humanised antibodies are used to evaluate, in

calls expressing Fas, and of inhibiting Fas-induced apoptosis in

calls expressing to treat such diseases, including autoimmune

interactions, and also to treat such diseases, including autoimmune

c disease (e.g. systemic lupus erythematosus, Hashimoto's disease,

c datases (e.g. systemic lupus erythematosus, Hashimoto's disease,

disease, rheumatoid arthritis, autoimmune hemolytic anaemia,

disease, rheumatoid arthritis, autoimmune hemolytic anaemia,

disease, rheumatoid arthritis, autoimmune hemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular neephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas.antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a bumanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a medulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allery, atopy, arteriosclerois, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand, apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft_rejection; light chain.

The products of the invention have anti-inflammatory, anti-antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotrople, antilnfertility, neuroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in

apptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic curves a sociated with the Fas/Fas ligand system, especially systemic curves us to state and the system of spaces. However, graft versus host disease, Slorgen's syndrome, pernicious or hypoplastic canemia, Addison's disease, soleroderma, Goodpasture syndrome, Crohn's disease, autcimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabbetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively cells, they bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HFEPA light chain MM type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 qqkpgqppklliyaasnlesgipdrfsgsgsgtdftltihpveeedaatyycqqsnedpr 120

chain of murine anti-human Fass monoclonal antibody HFEFA.

CHumanisation of the murine sequence (see AAM83042) entailed making P47A, K49R, H80S, P81R, V82L, E85A, A87F and T89V amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSGHH7 SANK 73497 harbors plasmid pHSGHH7 carrying a fusion fragment of the humanised HH Type HFEFA light chain and DNA encoding the region of human colimmunoglobulin kappa chain, and is deposited as FERM BP-6073 (claimed). The inventron provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFEFA (see AAW83031-37), like native HFEFA, are capable of inducing capptosis in abnormal cells expressing Fas, and of inhibiting Fas-Induced apoptosis in normal cells. The humanised antibodies considered to evaluate, in animal models, treatments of diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sjogren syndrome, pernicious anamia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thromopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence of the HH type humanised light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Akio S, Hideyuki H, Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas Fantibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                allergy, acopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFD7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-Fas antibody; monoclonal antibody HFB7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; appoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft@rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand gystem e.g. autoimmune diseases, contains anti-Fas antibody - \frac{\pi}{4\pi}

The products of the invention have anti-inflammatory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                           121 TFGQGTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180

(B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised antibody HFE7A light chain HH type which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                               viral
                  immunomodulatory, dermatological, immunosuppressive, thyromimetic, antithemmatic nephrotropic, antiinfartility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, heumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomeriliosphritis, hepatitis (fulminant, chronic, viral

This is the amino acid sequence of the PDHH type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAN80342) entabled making DIE, P47A, K49R, H80S, P81R, V82L, E84P, A81F, T89V and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coli pHSHH5 SANK 70398 harbors plasmid pHSHH5 carrying a fusion fragment of the humanised PDHH type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host energy methods for inducing apoptosis in abnormal cells.

Expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of dissesses that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythemacosus, Hashimoto's disease, carefurlitis, autoimmune haemolytic anaemia, disease, rheumatoid arravis, multinen haemolytic anaemia, sterility, mvashbenia gravis, multinen haemolytic anaemia, m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS

Sequence

(complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, applementals, apparatic anaemia (pannyalpohthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region: CDR; human Fas; Fas Ilgand, Apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft@reficention; light chain. The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fassantibody as the active component. The anti-Fas antibody is either the murine anti-luman Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody - $\frac{2}{3}$ 121 TFGQGTRLEIKRTVAAPSVFIFPPSDEQLKSGTASVVCLLNNFYPREAKVQWKVDNALQS 180 QQKPGQAPRLLIYAASNŒESGIPDRFSGSGSGTDFTLTIHPVEEEDAATYYCQQSNEDPR 120 1 METDTILLWVLLLWVPGSTGDIVLTQSPGTLSLSPGERATLSCKASQSVDYDGDSYMNWY 60 181 GNSQESVTEQDSKDSTYSLSSTLTLSKADYEKHKVYACEVTHQGLSSPVTKSFNRGEC 238 Indels Humanised anti-Fas antibody light chain, SEQ ID NO:107.
